Kopiah, A New Tomato Variety Developed In Mississippi

By JOHN A. CAMPBELL and DOUGLAS C. BAIN

Kopiah, a new high-yielding tomato variety adapted to both the mature-green market and canning, has been developed at the Truck Crops Branch Experiment Station at Crystal Springs. In five years of testing the new variety out-yielded Rutgers by an annual average of 36.4 field boxes per acre.

Seed was released January 1951 to seed companies for increase purposes and is offered by dealers to growers in limited quantities for the 1953 season.

Characteristics

Kopiah produces a stocky, indeterminate plant which exhibits more vigor than Rutgers. Under Mississippi conditions its foliage is a shade darker green and somewhat more dense giving better fruit coverage than Rutgers. The fruit are globe in shape having a shape index of .86, (shape index equals depth divided by breadth), and the average size is equal to Rutgers. The clusters are borne fairly close together on the plant and usually have from six to eight fruit each. In Mississippi Kopiah is three days earlier than Rutgers.

Compared with Rutgers the fruit are smoother with thicker outer and radial walls. At the mature-green stage the fruit have a shade darker green color which changes to a uniform dark red color upon ripening. This characteristic seems desirable among buyers in the Crystal Springs-Hazlehurst areas. According to reports from various States and comparisons made at the Truck Crops Branch Station in Mississippi, Kopiah develops a darker red color which is particularly desirable for canning. It has a much smaller stem scar which adds to its smoothness and general appearance. Commercial trial reports indicate that the fruit are firmer than Rutgers and that they hold up better during shipment.

Resistance to Fusarium Wilt

Fusarium wilt is a disease of prime importance and can be controlled only by use of resistant varieties. Kopiah is one of

Large clusters of Kopiah tomatoes close together on plant at Truck Crops Branch Experiment Station.

the very few commercial varieties that has true resistance to the disease. The factor for this resistance was obtained from the wild red-currant tomato (*L. pimpinellifolium*) in the original cross and was established in Kopiah by repeated selections of disease-free plants from inoculated seedlings.

Yield

Kopiah has consistently outyielded Rutgers in tests conducted over a period of five years at Crystal Springs. Results of these trials are shown in Table I. The increased yields varied from 10 to 73 field boxes per acre more than Rutgers with an average increase of 36.4 field boxes per acre for the five years. In these trials plants were pruned to two stems, staked and spaced two feet apart on rows 3½ feet wide. Commercial growers in the Crystal Springs area have indicated the same trend of increased yield.

Observational and replicated trials throughout the South and by seedsmen in the middle western and northern States have indicated that Kopiah has a wide range of adaptability.

Canning Quality

Large scale canning tests were run in 1948 and 1949 comparing Kopiah with Rutgers when processed into catsup by a large commercial canning company. These tests indicated that Kopiah was equally as good if not slightly better than Rutgers as a processing tomato. Quality control determinations for the tests mentioned above are shown in Table II. In both tests Kopiah exceeded Rutgers in percent total solids.

Table I—Replicated yield tests for five years comparing Kopiah with Rutgers

Variety	Yield—Field boxes* of U. S. No. 1 and No. 2 Grades green-wrap fruit per acre					Five-year average
	1947	1948	1949	1951	1952	
Kopiah	183.6	202.7	126.0	199.4	188.2	179.9
Rutgers	156.5	129.0	116.0	159.0	157.3	143.5
Difference	27.1	73.7	10.0	40.4	30.9	36.4

*A field box of green-wrap tomatoes weighs approximately 70 pounds.

Table II—Quality control tests on red ripe fruit of Kopiah and Rutgers—1948 and 1949.
